

ISIS/The National Gallery, London Real Time Asset Protection

Case Study

Wavetrend Channel Partner

ISIS has been developing world-class RFID software from its headquarters in London, UK since 1996. The company delivers turnkey solutions for some of the world's largest organizations.

The technology team at ISIS has developed the award-winning Aspects™ suite of products to track, protect and manage critical assets in real time. Asset tracking systems bolster efficiency, substantially reduce costs and manpower, and yield new information about business processes.

Business Challenge

The National Gallery required a system that would, within a limited budget, improve the security of its exhibits and its staff. Its implementation should have no impact on the public's viewing experience and minimal physical impact on the building. The alarm information needed to be real time, to be active while visitors were in the building and to be capable of producing an automated audit trail.

The project needed to be approved by diverse groups with differing agendas – security, curators, collection managers, exhibition organizers and conservators. A degree of granularity was required to protect individual works of art rather than simply securing a room or a perimeter.

Solution

To address this unique challenge, ISIS used Wavetrend Active RFID tags, incorporating a dual-mode motion-sensing feature to detect either vibration or tilt.

These would transmit a signal every 15 seconds for a minimum period of five years, thus reducing the human cost involved in swapping tags on expensive artworks.

The first part of the contract entailed installing the system to monitor the museum's reserve collection. This has now been extended to works of art on display in the main galleries, and issuing security guards with Wavetrend panic alarm key fob tags to enhance their personal protection.

Through concealed Wavetrend receivers, the tags "check in" to Aspects™ ARTS software which alerts when a tag goes missing from the audit within seconds. The same software warns if the receiver network is in any way compromised. In the event of an alarm, screens display the location of the artwork or security guard at risk and CCTV is displayed and recorded for visual verification and evidence.

The system requires minimal day to day management and alarm thresholds can be set for individual works of art.

Results

- Enhanced security of works of art and security guards
- Improved integration of security systems
- Instant precise location information
- Electronic historical log of all alarms
- Potential to reduce expensive, manned security

Customer Comments

"The RFID technology of the Wavetrend tags, coupled with the powerful ISIS Aspects software has provided another important layer in the security array of the National Gallery. Contrary to popular belief, major works of art do not hang forever in the same place in the same galleries. Because of this a mobile, flexible and non-intrusive approach to object alarms is essential. Wavetrend and Aspects delivers this and, to date, I have seen nothing that matches the functionality and performance".

- Jon Campbell
Head of Visitor Services & Security, The National Gallery
